## **1.0 INTRODUCTION**

The Douglas Aircraft Company (DAC) C-6 Facility is located at 19503 South Normandie Avenue, Torrance, California (Figure 1). Quarterly groundwater sampling is being conducted in response to the California Regional Water Quality Control Board - Los Angeles Region correspondence to DAC, dated 7 April 1992. This report summarizes laboratory analytical data generated through the chemical analysis of groundwater samples collected during the period of 21 and 22 December 1994, Fourth Quarter 1994.

## **2.0 QUARTERLY MONITORING PROGRAM**

Fourth Quarter 1994 groundwater sampling was performed in accordance with standard sampling procedures. Static water level depths were measured on 21 December 1994 prior to initiating purging of groundwater from any observation wells. Static water depths on monitoring wells (MW-9, MW-18 and MW-19) located in the southern portion of the DAC property installed for the Montrose Chemical Corporation Remedial Investigation were not measured for this quarter.

Groundwater samples were collected from the following fifteen wells (Figure 2) and chemically analyzed for volatile organic compounds (VOCs) by EPA Method 8240/8260 for the Fourth Quarter 1994.

WCC-1S, WCC-2S, WCC-3S, WCC-4S, WCC-5S, WCC-6S, WCC-7S, WCC-8S, WCC-9S, WCC-10S, WCC-11S, WCC-12S, WCC-1D, WCC-3D, and DAC-P1.

Table 1 summarizes observation well construction details. Tables 2 and 3 summarize the results of chemical analysis of groundwater samples and duplicates for major and minor constituents at the C-6 facility, respectively. Chemicals detected in samples from each observation well are shown in Figure 3. Table 4 summarizes available measured groundwater elevations to date. Estimated groundwater elevation contours for the Fourth Quarter are presented in Figure 4. Historical chemical concentration profiles for the indicator chemicals trichloroethene and 1,1-dichloroethene are shown in Figure 5. Copies of laboratory data sheets, laboratory/field Quality Control data sheets, groundwater purge and sample forms, and Chain-of-Custody records are included in Appendices A, B, C, and D respectively.

### **2.1 Groundwater Sampling Procedures**

Prior to collecting groundwater samples from each well, groundwater was purged using an electrical submersible pump that was temporarily installed in the observation well. Observation well WCC-1S was purged with a bailer since the 2-inch casing size would not accommodate a pump. After lowering the pump to the approximate mid-point of the saturated well screen, approximately three to five wetted casing volumes of groundwater were purged from the well until the

following groundwater monitoring parameters had stabilized to within 10% of preceding values: pH, electrical conductivity, temperature and clarity. Purged groundwater was stored onsite in DOT approved 55 gallon barrels pending the results of laboratory analysis of samples.

Following groundwater purging, the submersible pump was removed from the well and a representative groundwater sample was collected using a steam-cleaned stainless steel point-source bailer equipped with top and bottom ball-check valves. The bailer was lowered to the approximate mid-point of the saturated well screen interval and retrieved to ground surface. The contents of the bailer were drained into three to four labelled 40-ml capacity vials, preserved with HCl.

## **2.2 Field QA/QC Procedures**

Duplicate groundwater samples were collected for the sampling rounds on 21 and 22 December 1994 for quality control purposes. The duplicates were collected in three HCl-preserved vials each and identified by inserting the collection date after "DW-" (DW-122194 and DW-122294). No further sample identification was provided to the laboratory. Samples DW-122194 and DW-122294 were taken from observation wells WCC-9S and WCC-10S, respectively.

Following decontamination of the bailer by steam-cleaning, and prior to collection of groundwater samples from the successive well, equipment rinsate blanks were prepared for laboratory analysis. The equipment rinsate blanks were prepared by pouring Reagent Grade II water, prepared by the analytical laboratory, through the bailer and discharge spigot and collecting the rinsate in four 40-ml vial preserved with HCl. The blanks were identified following a similar protocol to that used for duplicate water samples and are identified as "FB-122194" and "FB-122294". The wells sampled before and after rinsate blank preparation were recorded. FB-122194 was collected after sampling WCC-11S, the last well sampled that day. FB-122294 was collected after sampling well DAC P-1, the last well sampled that day. Trip blanks were also analyzed for both days of sampling and shipping and are identified as TB-122194 and TB-122294.

All groundwater, duplicate, and field blank samples were transported in ice-cooled chests to Terra Tech Labs, Inc., Irvine, California using U.S. EPA-recommended Chain-of-Custody procedures.

## **3.0 EVALUATION OF ANALYTICAL RESULTS**

### **3.1 Groundwater Gradient**

Groundwater levels were measured prior to sampling on 21 December 1994 (Table 4 and Appendix C). The shallow zone groundwater elevations over the C-6 facility range from 16.25 feet below mean sea level (MSL) to 17.74 feet below MSL. An estimated potentiometric surface map for the shallow zone as measured on this day is presented as Figure 4. Water level measurements show little change over the

DAC C-6 facility since the September 1994 quarterly monitoring, with the exception of a rise in water levels at WCC-9S. Relative to other wells in this area of the C-6 facility, this higher water level at WCC-9S is consistent with fall and winter quarters of 1993. The groundwater gradient in the shallow zone was generally south-southeast with a southerly directed trough-like depression between observation wells WCC-10S and WCC-12S.

Insufficient data (two wells) are available to define the groundwater gradient in the deeper zone. Groundwater elevation in the two wells (WCC-1D and WCC-3D) is approximately 17.55 and 17.42 feet below MSL, respectively.

### **3.2 Analytical Data**

The results of chemical analysis of groundwater and duplicate samples are summarized in Tables 2 and 3. Table 2 lists major constituents and Table 3 lists additional minor constituents of samples tested. The duplicate groundwater samples are indicated by an asterisk and are presented with the "original" groundwater samples. These tables include cumulative analytical data for all monitoring wells and detection limits (where available) for the listed chemicals.

The following observations are noted:

- Data for groundwater samples collected from well DAC-P1, located at the upgradient property boundary, indicate a TCE concentration of 11,000 micrograms per liter ( $\mu\text{g}/\text{L}$ ) coming onto DAC's property. This test result is consistent with prior sampling events. DAC-P1 is screened in the shallow zone.
- Background concentrations of TCE and 1,1-DCE in the shallow zone upgradient or cross gradient wells WCC-10S, WCC-2S, and WCC-11S remain in the range of 100  $\mu\text{g}/\text{L}$  of TCE and tens of  $\mu\text{g}/\text{L}$  of 1,1-DCE.
- Groundwater elevation data (Figure 4) and chemical concentration data (Figure 3) indicate that chemical transport in the shallow zone is in a generally southerly to southeasterly direction in the vicinity of buildings 36 and 41. Chemical concentration data from the eastern boundary observation wells (WCC-5S, and WCC-9S) are within the same range or lower than upgradient or cross gradient "background level" wells (WCC-10S, WCC-2S and WCC-11S).
- WCC-1S data showed a slight increase in 1,1-DCE, 1,1-DCA, 1,1,1-TCA, and TCE over recent historical data.
- WCC-11S data showed low level detections of 1,1,1-TCA and toluene, not detected in previous monitoring events.

- September 1994 data for WCC-3D showed elevated levels of several chemicals over the preceding three quarters, specifically 1,1-DCE, 1,1,1-TCA, and TCE. December 1994 data also show an increase in concentrations of these chemicals as well as increases in concentrations of cis 1,2-DCE, trans 1,2-DCE, benzene, and toluene.
- Chemical concentration variances within all observation wells (other than WCC-1S, WCC-11S, and WCC-3D discussed above) were typical of historical ranges.
- Analytical data from the equipment rinsate blanks, sample duplicates, trip blanks, and laboratory spikes and duplicates are indicative of reliable data.

## Notes:

1. Reference point is north side, top of well casing
2. Reference point elevation measured by Hargis + Associates, Inc.
3. Data taken from Woodward-Clyde Consultants Phase II Report, May 1988.
4. Data taken from Woodward-Clyde Consultants Phase III Report, March 1990.
5. N/A - Not Available - No access to offsite wells.
6. Installed by Hargis + Associates, Inc. for Montrose Chemical Corporation
- Water Level Elevation not measured due to wellhead obstructions.

# 190 THI. ST.

## NORMANDIE AVE.

- 1) Write only one sample number in each space.
  - 2) Specify type of sample(s): Water (W), Solid (S), or indicate type.
  - 3) Mark each sample which should be composited in Laboratory as follows: Place an "A" in box for each sample that should be composited into one sample; use sequential letter for additional groups.
  - 4) Preservation of samples.
  - 5) Write each analyses requested across top. Place an "X" in appropriate column to indicate type of analysis.
